We engage in a broad range of research activities and promote a culture of best practices in critical care nutrition.

Home - Critical Care Nutrition

There are guidelines that outline recommendations for ICU nutrition for PICS patients and methods for providing nutritional substrates in both early and late phase of ICU hospitalisation. These recommendations also highlight the importance of early mobilisation and exercise and post-extubation support.

Nutrition in the ICU - HealthManagement.org

OBEsITY. For all classes of obesity where BMI is > 30, it is suggested the goal of the EN regimen not exceed 65-70% of target energy requirements as measured by IC. If IC unavailable, suggest 11-14 kcal/kg ABW*/day for BMI 30-50, and 22-25 kcal/kg IBW**/ day for BMI > 50.

A summary for Adult Critically Ill Patients

Protein around 1.5 g/kg/day (range 1.2 to 2.0 g/kg/day for ICU patients) Use 2g/kg/day if severely catabolic eg. severe sepsis/burns/trauma Provides 5.3 kcal/g Lipid Provides 9.3 kcal/g Calories from lipid should be limited to 40% of total calories Carbohydrate Provides 3.75 kcal/g in vivo.

Nutrition in ICU

For patients with a BMI <30, protein requirements should be in the range of 1.2-2.0 gm/kg actual body weight. For patients with a BMI >30, protein requirements should be in the range of 1.2-2.0 gm/kg/day of adjusted body weight. b.

ICU ENTERAL FEEDING GUIDELINES - SurgicalCriticalCare.net

In the early phase of critical illness, the guidelines recommend keeping caloric intake below 70% of either measured or calculated REE (level B). The recommendation to target measured REE thereafter was graded "evidence level 0" reflecting the lack of evidence in support of IC-guided nutrition therapy.
