Physics 772 Peskin and Schroeder Problem 3.4 Problem 3.4 a) We start with the equation $\gamma^\mu \partial_\mu \psi = 0$. Define $R_L = \frac{1}{\sqrt{2}}(1 - \gamma_5)$ and $R_R = \frac{1}{\sqrt{2}}(1 + \gamma_5)$. Remember we showed in class (and it is shown in the text) that if ψ transforms as a left-handed Weyl fermion, then $\psi_L = R_L \psi$ transforms as a right-handed fermion. Furthermore, remember that it was shown in the text and in the notes that

In this note I provide solutions to all problems and nal projects in the book An Introduction to Quantum Field Theory by M. E. Peskin and D. V. Schroeder [1], which I worked out and typed into TEX during the first two years of my PhD study at Tsinghua University. I once posted a draft version of them on my personal webpage using a server provided by

I have a complementary derivation to udv's answer, it is based on the hydro-bacteriological analogy discussed in the textbook by Peskin and Schroeder. To me, it helps to understand the physical content of Eq.(12.75) from an a somewhat different aspect. The relation between the hydro-bacteriological environment and running coupling constant is as follows $\log(p/M) \rightarrow t \dots$

Daniel V. Schroeder: An Introduction to Thermal Physics Here are my solutions to various problems in the textbook An Introduction to Thermal Physics, by Daniel V. Schroeder (Addison-Wesley, 2000). Obviously I can't offer any guarantee that all the solutions are actually correct, but I've given them my best shot. These solutions are the only ones that I've worked out so far, so please don't ask ...

Homer Reid's Solutions to Peskin and Schroeder Problems: Chapter 32 where $p = 1 + ((i+1) \bmod 3)$ and $q = 1 + ((i+2) \bmod 3)$. In the second commutator we can switch q and p and simultaneously flip the sign since J is antisymmetric to obtain $[J_p, J_0] = i(p - q)J_0$ and $[J_q, J_0] = i(q - p)J_0$.
